

Features

- DC input range: 250 425V
- Input surge withstand: 500V for 100ms
- DC output: 12V
- Programmable output: 10 to 110%
- Regulation: ±0.2% no load to full load
- Efficiency: 85.7%
- Maximum operating temperature: 100°C at full load
- Power density: 119W/cubic inch
- Height above board: 0.43 in. (10,9 mm)
- Parallelable, with N+M fault tolerance
- Low noise ZCS/ZVS architecture

Typical Applications: distributed power; off-line systems using power PFC front-ends; electric vehicles

Product Overview

This DC-DC converter module uses 2nd Generation power processing, control and packaging technologies to provide the performance, flexibility and cost effectiveness expected of a mature power component. For example, a plated-cavity core transformer couples widely separated primary and secondary windings, resulting in low in-toout parasitic capacitance and noise. High frequency ZCS/ZVS switching, advanced power semiconductor packaging and thermal management provide high power density with low temperature gradients. Extensive use of silicon integration results in 1/3 the part count of a 1st Generation converter.

For pin styles see page 6. Slotted baseplate (style 1) requires no designator. For threaded baseplate add a "2" to the end of the part number. For thru-hole, add a "3". *See page 7 for dimensions.*

ELECTRICAL CHARACTERISTICS

Electrical characteristics apply over the full operating range of input voltage, output load (resistive) and baseplate temperature, unless otherwise specified. All temperatures refer to the operating temperature at the center of the baseplate.

MODULE OPERATING SPECIFICATIONS

Parameter	Min	Тур	Мах	Unit	Notes
Operating input voltage	250	375	425	Vdc	
Input surge withstand			500	Vdc	<100ms
Output voltage setpoint	11.88	12.00	12.12	Vdc	Nominal input; full load; 25°C
Output OVP setpoint	13.7	14.3	14.9	Vdc	25°C; recycle input voltage to restart (1 minute off)
Output power			600	Watts	At 100°C baseplate temperature
Efficiency	84.7	85.7		%	Nominal input; 75% of full load; 25°C

MODULE INPUT SPECIFICATIONS

Parameter	Min	Тур	Мах	Unit	Notes
Undervoltage turn-on		242.5	247.5	Vdc	
Undervoltage turn-off	204.7	212.2		Vdc	
Overvoltage turn-off/on	429.2	446.3	467.5	Vdc	
Dissipation, standby		8.7	13.0	Watts	No load

MODULE OUTPUT SPECIFICATIONS

Parameter	Min	Тур	Max	Unit	Notes
Line regulation		±0.02	±0.20	%	Low line to high line; full load
Load regulation		±0.06	±0.20	%	No load to full load; nominal input
Temperature regulation		±0.002	±0.005	% / °C	Over operating temperature range
Ripple and noise, p-p		120	150	mV	Nominal input, full load; 25°C; 20MHz bandwidth
Current limit	51.0	57.5	65.0	Amps	Output voltage 95% of nominal
Short circuit current	35.0	57.5	65.0	Amps	Output voltage <250mV
Power sharing accuracy		±2	±5	%	10 to 100% of full load
Programming range	10		110	%	Of nominal output voltage. For trimming below 90% of nominal, a minimum load of 10% of maximum rated power may be required.

Module Enable/Disable

The module may be disabled by pulling PC below 2.3V with respect to the –Input. This may be done with an open collector transistor, relay, or optocoupler. Multiple converters may be disabled with a single transistor or relay either directly or via "OR'ing" diodes. See Figure 1.

Primary Auxiliary Supply

At 5.7V, PC can source up to 1.5mA. In the example shown in Figure 3, PC powers a module enabled LED.

Module Alarm

The module contains "watchdog" circuitry which monitors input voltage, operating temperature and internal operating parameters. In the event that any of these parameters are outside of their allowable operating range, the module will shut down and PC will go low. PC will periodically go high and the module will check to see if the fault (as an example, overtemperature) has cleared. If the fault has not been cleared, PC will go low again and the cycle will restart. The SC pin will go low in the event of a fault and return to its normal state after the fault has been cleared. See Figures 2 and 4.

Output Voltage Programming

The output voltage of the converter can be adjusted or programmed via fixed resistors, potentiometers or voltage DACs. See Figures 7 and 8.

Figure 7—Output voltage trim down circuit.

Trim Down

- 1. This converter is <u>not</u> a constant power device it has a constant current limit. Hence, available output power is reduced by the same percentage that output voltage is trimmed down. Do not exceed maximum rated output current.
- 2. The trim down resistor must be connected to the -Sense pin.

Figure 8—Output voltage trim up circuit.

Trim Up

- 1. The converter is rated for a maximum delivered power. To ensure that maximum rated power is not exceeded, reduce maximum output current by the same percentage increase in output voltage.
- 2. The trim up resistor must be connected to the +Sense pin.
- 3. Do not trim the converter above maximum trim range (typically +10%) or the output over voltage protection circuitry may be activated.

Parallel Operation

The PR pin supports paralleling for increased power with N+1 (N+M) redundancy and phased array capability. Modules of the same input voltage, output voltage, and power level will current share if all PR pins are suitably interfaced.

Compatible interface architectures include the following:

DC coupled single-wire interface. All PR pins are directly connected to one another. This interface supports current

AC coupled single-wire interface. All PR pins are connected to a single communication bus through 0.001μ F (500V) capacitors. This interface supports current sharing and is fault tolerant except for the communication bus. See Figure 10.
